CLAIMS

1. A device comprising:

a substrate;

at least one solid-state optical amplifier attached to the substrate; and

a plurality of mirrors attached to the substrate and moveable relative to the substrate independent of each other;

wherein light having a wavelength within a selected range enters the device, is amplified by the amplifier and reflected by one of the mirrors to exit the device in a direction controlled by the mirror.

- 2. The device of claim 1, wherein the light is amplified by the amplifier before and after reflection by the mirror.
- 3. The device of claim 1, wherein the amplifier is attached to the mirror and moves with the mirror relative to the substrate.
- 4. The device of claim 1, wherein the amplifier is contained in the substrate.
